## WOOD PROFESSIONAL PREPARATION & TREATMENT PROCESS

*For small Industry use. Please contact us for bigger industrial purposes*

\*\*\*\*\*

Freemite200+ has been designed not only to be efficient but also to provide a convenient and simple process for professional use.

For optimal penetration and protection, here are our step-by-step recommendations in using Freemite200+.

- 1 Prepare the wood sections and clean them
  - To clear the surface from impurity, dust, etc.
- 2 Immerse fully the wood sections in a pool of Freemite200+ diluted with clean and non-chlorinated water. Leave them to soak for 24 to 72 hours (depending on the hardness and section of the wood)
  - To treat them against termites
- 3 Dry the wood sections shortly above the pool
  - To allow the treatment inside the wood to drop back in the pool. You can then add another batch of wood in the pool

- 4 Dry the wood 1 day under the sun
- 5 Store the wood in a dry, ventilated horizontal place
  - The treated wood is ready for production

## IMPORTANT TIPS TO ENSURE OPTIMUM EFFICIENCY OF A FREEMITE200+ BATH

- ❖ Each bath will be efficient up to 30 to 50 days depending on the local environmental conditions (especially dust), your own care, the cleanness of the water and the wood
- ❖ Cover the pool when the wood sections are soaking in order to avoid dust coming in
- ❖ Clean the bath with a net skimmer every time you take out the wood section from the pool

These tips should avoid particles and bacteria to develop in the bath. The longer the bath is used, the more it will bring down the cost of the treatment per bamboo.

If the bath smells it implies there are too many bacteria. In case of heavy smell, prepare a new batch of diluted FREEMITE200+ and use the old one as a fertilizer for your fields, your garden or to treat the foundations of your constructions against subterranean termites, powder post beetles and woodworms.
